

TECHNICAL SKILL ASSESSMENT

Lost & Found Platform — Web Application Prototype

Assessment Duration: 5 Days | Deployment: Not Required

1. Objective

Build a clean, functional Lost & Found web application that allows users to report lost or found items, search listings, and update the status of an item. The purpose of this assessment is to understand your practical development skills, problem-solving ability, code quality, and ability to complete a requirement independently.

2. Functional Requirements

User Module

- Register and Login.
- View a personal profile.
- Report a Lost Item.
- Report a Found Item.
- View available Lost & Found listings.
- Search and filter listings.
- Open an item to view complete details.
- Mark an item as Found / Claimed where applicable.

Lost / Found Item Details

- Item Name
- Category
- Description
- Date
- Location
- Photo/Image (optional if time permits)
- Current Status

Admin Module

- Admin dashboard with basic statistics.
- View all reported items.
- Approve or reject submitted reports.
- Remove inappropriate or invalid posts.
- View claimed/closed items.

3. Matching Logic

Implement a simple matching feature. When a user reports a Found Item, the system should display possible Lost Item matches using basic fields such as category, location, date, and keywords. A simple rule-based approach is sufficient; advanced AI or machine learning is not required.

4. Technical Guidelines

- You may use any technology stack you are comfortable with.
- Frontend, backend, database, and supporting libraries are your choice.
- You may use mock/local data if you are implementing the project as a prototype.
- The application should be responsive and usable on desktop and mobile screens.
- Include appropriate form validation and basic error handling.
- Keep the project structure clean and maintainable.
- Deployment is not required.

5. AI / External Assistance Policy

AI TOOLS ARE NOT PERMITTED FOR THIS ASSESSMENT.

Do not use ChatGPT, GitHub Copilot, Claude, Gemini, Cursor AI, or any other AI coding/writing assistant to generate, modify, or complete the project.

You may use official documentation and normal technical references for understanding syntax, framework APIs, libraries, and errors. Any code submitted should be your own work and you must be able to explain the implementation.

6. Submission Requirements

- Complete source code.
- README.md containing setup steps, technology stack, features, and any assumptions.
- Database schema / sample data if a database is used.
- Screenshots of the major screens.
- A short explanation of the project architecture and important decisions.
- Submit the project before the 5-day deadline.

7. Evaluation Criteria

Area	Weight
Functionality & Requirements	30%
UI / UX & Responsiveness	25%
Code Quality & Project Structure	20%
Logic & Problem Solving	15%
Validation & Error Handling	10%

8. Important Note

Do not focus on adding unnecessary features. A smaller application that is complete, clean, well-structured, and fully understood by you will be valued more than a large application with unfinished or copied functionality.

You may be asked to explain your implementation and demonstrate the application after submission.
